SULIT

SECTION A : 40 MARKS**BAHAGIAN A : 40 MARKAH****INSTRUCTION:**

This section consists of **TEN (10)** short questions. Answer **ALL** questions.

ARAHAN :

*Bahagian ini mengandungi **SEPULUH (10)** soalan pendek. Jawab **SEMUA** soalan.*

QUESTION 1**SOALAN 1**

CLO1
C1

List down the process that involved in hydrological cycle.

Senaraikan proses-proses yang terlibat dalam kitaran hidrologi.

[4 marks]

[4 markah]

QUESTION 2**SOALAN 2**

CLO1
C2

Describe hydrology continuity equation together with the meaning of each symbol.

Terangkan persamaan keseimbangan hidrologi berserta maksud setiap simbol.

[4 marks]

[4 markah]

QUESTION 3**SOALAN 3**

CLO1
C3

In the next two months, Johor Bahru District has estimated rainfall of 265 mm.

Evaporation is estimated at 75 mm and infiltration into the subsurface by 25 mm. Calculate the volume of runoff to be stored in the reservoir if the catchment area is 80 km².

Dalam jangkamasa dua bulan, daerah Johor Bahru dianggarkan menerima hujan sebanyak 265 mm. Penyejatan dianggarkan sebanyak 75 mm dan penyusupan ke sub permukaan sebanyak 25 mm. Kirakan isipadu air larian permukaan yang akan tersimpan di takungan sekiranya luas kawasan tadahan ialah 80 km².

[4 marks]

[4markah]

QUESTION 4**SOALAN 4**

- CLO1
C1 List down **FOUR (4)** types of precipitation
Senaraikan **EMPAT (4)** jenis curahan

[4 marks]

[4 markah]

QUESTION 5**SOALAN 5**

- CLO1
C2 Calculate the mean precipitation for the following data in **Table A5** by using the Arithmetic Mean Method.

Kirakan purata hujan bagi data dalam **Jadual A5** menggunakan Kaedah Purata Aritmetik.

Table A5 / Jadual A5

| Station No./ Bil. stesen | Precipitation/ Curahan (mm) |
|--------------------------|-----------------------------|
| 1 | 30.8 |
| 2 | 34.6 |
| 3 | 32.0 |
| 4 | 24.6 |

[4marks]

[4markah]

QUESTION 6**SOALAN 6**

- CLO1
C3 Calculate the mean areal precipitation for the following data in **Table A6** by using Polygon Thiessen method.

Kirakan purata hujan bagi data dalam **Jadual A6** dengan menggunakan Kaedah Poligon Thiessen.

Table A6/ Table A6

| Station/Stesen | Precipitation/Curahan (mm) | Area/Luas (km ²) |
|----------------|----------------------------|------------------------------|
| A | 30 | 20 |
| B | 50 | 15 |
| C | 35 | 29 |

[4 marks]

[4 markah]

QUESTION 7**SOALAN 7**

- CLO1
C1 List **FOUR (4)** catchment characteristics which affect runoff.

Senaraikan **EMPAT (4)** ciri tadahan yang mempengaruhi air larian.

[4 marks]

[4 markah]

QUESTION 8

SOALAN 8

CLO1
C1

Define the components of hydrograph below:

Takrifkan komponen hidrograf di bawah:

- a. Peak flow [2 marks]
Kadar alir puncak [2 markah]
- b. Rising limb [2 marks]
Lengkung menaik [2 markah]

QUESTION 9

SOALAN 9

CLO1
C2Given $X = 0.25$, $k = 6$ hours and $\Delta t = 6$ hours. Calculate the value of C_2 and C_3 by using Muskingum Method.*Diberi $X = 0.25$, $k = 6$ jam dan $\Delta t = 6$ jam. Kirakan nilai C_2 and C_3 dengan menggunakan kaedah Muskingum.*[4 marks]
[4 markah]

QUESTION 10

SOALAN 10

CLO1
C2

Identify the values of coefficient of IDF Polynominal Equations at Batu Pahat, Johor. Given ARI is 20 years.

Kenalpasti nilai-nilai koeffisien bagi Persamaan Polinomial IDF di Batu Pahat, Johor. Diberi nilai ARI ialah 20 tahun.[4 marks]
[4 markah]

SECTION B : 60 MARKS

BAHAGIAN B : 60 MARKAH

INSTRUCTION:

This section consists of **FOUR (4)** structured questions. Answer **THREE (3)** questions only.

ARAHAN:

Bahagian ini mengandungi EMPAT (4) soalan berstruktur. Jawab TIGA (3) soalan sahaja.

QUESTION 1

SOALAN 1

CLO2
C4Calculate the river discharge based on the **Table B1** below, consider the rates of current meter as $V = 0.05 + 0.9N$ *Kirakan kadar alir sungai berdasarkan Jadual B1 di bawah dengan mengambil kadar meter arus sebagai $V = 0.05 + 0.9N$.*

Table B1/Jadual B1

| Distance From River Bank, (m) | Depth, (m) | Current meter depth, (m) | Rotation, R | Time (s) |
|-------------------------------|------------|--------------------------|-------------|----------|
| 0.5 | 1.0 | 0.6d | 15 | 50 |
| 1.5 | 4.0 | 0.2d | 30 | 55 |
| | | 0.8d | 48 | 53 |
| 2.8 | 5.5 | 0.2d | 40 | 46 |
| | | 0.8d | 60 | 54 |
| 3.5 | 6.5 | 0.2d | 45 | 48 |
| | | 0.8d | 67 | 52 |
| 4.2 | 4.5 | 0.2d | 33 | 54 |
| | | 0.8d | 51 | 50 |
| 5.5 | 2.5 | 0.2d | 26 | 48 |
| | | 0.8d | 44 | 55 |
| 6.5 | 1 | 0.6d | 20 | 47 |

[20 markah]

QUESTION 2

SOALAN 2

CLO2
C4

Table B2 below shows the discharge of a river. If the base flow is $3 \text{ m}^3/\text{s}$, and the catchment area is 5 km^2 , determine:

Jadual B2 menunjukkan kadar alir sebatang sungai. Sekiranya aliran dasar $3 \text{ m}^3/\text{s}$ dan keluasan kawasan tadahan, 5 km^2 , tentukan

a) Direct runoff volume, m^3
Isipadu air larian terus, m^3

b) Runoff depth, cm
Kedalaman air larian, cm

c) Unit hydrograph
Unit hidrograf

Table B2 / Jadual B2

| Time (hour) Masa (jam) | Discharge (m^3/s) Kadar alir (m^3/s) |
|---------------------------|---|
| 1 | 3.76 |
| 2 | 4.98 |
| 3 | 6.56 |
| 4 | 7.88 |
| 5 | 9.74 |
| 6 | 15.54 |
| 7 | 13.20 |
| 8 | 11.02 |
| 9 | 9.76 |
| 10 | 8.63 |
| 11 | 7.55 |
| 12 | 6.50 |
| 13 | 4.43 |
| 14 | 3.37 |

[20 marks]

[20 markah]

QUESTION 3

SOALAN 3

CLO2
C4

Hydrograph of a river in Negeri Sembilan is shown in the **Table B3**. If the value of $X = 0.23$ and K is 8.5 hours with initial outflow of $75 \text{ m}^3/\text{s}$, calculate the hydrograph outflow of the river using by Muskingum method.

Hidrograf sebatang sungai di Negeri Sembilan adalah seperti **Jadual B3**. Jika nilai $X = 0.23$ dan K ialah 8.5 jam dengan aliran keluar awalnya sebanyak $75 \text{ m}^3/\text{s}$, kirakan kadar aliran keluar sungai tersebut menggunakan kaedah Muskingum.

Table B3 / Jadual B3

| Time (hours) | Hydrograph inflow (m^3/s) |
|---------------|---|
| 0 | 120 |
| 3 | 320 |
| 6 | 480 |
| 9 | 550 |
| 12 | 600 |
| 15 | 650 |
| 18 | 400 |
| 21 | 380 |
| 24 | 250 |
| 27 | 100 |

QUESTION 4

SOALAN 4

Below is the information of high density residential areas in Melaka;

Maklumat di bawah adalah data bagi kawasan kediaman kepadatan tinggi di Melaka;

Housing Area = 30 hectares

Luas kawasan perumahan = 30 hektar

Drainage Type = Minor drainage

Jenis saliran = Saliran minor

Length of overland flow = 80 m

Panjang saliran atas tanah = 80 m

Length of the drain = 400 m

Panjang saluran = 400 m

Slope average = 1%

Purata kecerunan = 1 %

CLO2
C3

- (a) By using Urban Storm Water Management Manual, calculate the time of concentration (t_c) for the areas.

Dengan menggunakan Manual Saliran Mesra Alam, kirakan masa penumpuan (t_c) bagi kawasan tersebut.

[4 marks]

[4 markah]

CLO2
C5

- (b) Estimate the peak flow of the areas.

Anggarkan aliran puncak bagi kawasan tersebut.

[16 marks]

[16 markah]

SOALAN TAMAT

Table 0.1 Design Storm ARIs for Urban Stormwater Systems

| Type of Development (See Note 1) | Average Recurrence Interval (ARI) of Design Storm (year) | | |
|---|--|---------------------------------|--|
| | Quantity | | Quality |
| | Minor System | Major System (see Note 2 and 3) | |
| Open Space, Parks and Agricultural Land in urban areas | 1 | up to 100 | 3 month ARI (for all types of development) |
| Residential: | | | |
| • Low density | 2 | up to 100 | |
| • Medium density | 5 | up to 100 | |
| • High density | 10 | up to 100 | |
| Commercial, Business and Industrial – Other than CBD | 5 | up to 100 | |
| Commercial, Business, Industrial in Central Business District (CBD) areas of Large Cities | 10 | up to 100 | |

- Notes:
- (1) If a development falls under two categories then the higher of the applicable storm ARIs from the Table shall be adopted.
 - (2) The required size of trunk drains within the major drainage system, varies. According to current practices the trunk drains are provided for the areas larger than 40 ha. Proceeding downstream in the drainage system, a point may be reached where it becomes necessary to increase the size of the trunk drain in order to limit the magnitude of "gap flows" as described in Section 0. **Error! Bookmark not defined..Error! Bookmark not defined..**
 - (3) Ideally, the selection of design storm ARI should also be on the basis of economic efficiency. In practice, however, economic efficiency is typically replaced by the concept of the level of protection. In the case where the design storm for higher ARI would be impractical, then the selection of appropriate ARI should be adjusted to optimise the ratio cost to benefit or social factors. Consequently lower ARI should be adopted for the major system, with consultation and approval from Local Authority. However, the consequences of the higher ARI shall be investigated and made known. Even though the stormwater system for the existing developed condition shall be designed for a lower ARI storm, the land should be reserved for higher ARI, so that the system can be upgraded when the area is built up in the future.
 - (4) Habitable floor levels of buildings shall be above the 100 year ARI flood level.
 - (5) In calculating the discharge from the design storm, allowance shall be made for any reduction in discharge due to quantity control (detention or retention) measures installed as described in Section 0. **Error! Bookmark not defined..**

APPENDIX 0.A DESIGN CHARTS

Design Chart 0.1 Nomograph for Estimating Overland Sheet Flow Times (Source: AR&R, 1977)
(Overland Sheet Flow Times - Shallow Sheet Flow Only)

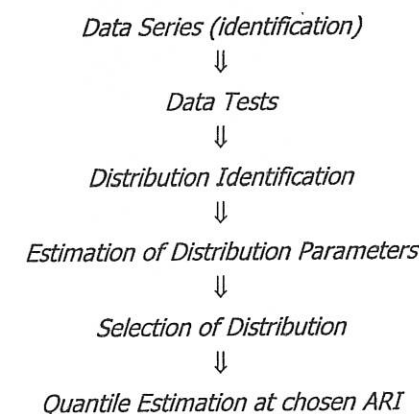

Design Chart 0.2 Kerb Gutter Flow Time

- The lower limit of the durations analysed was 15 minutes. DID should expedite the installation of digital pluviometers to capture data from short storm bursts, down to 5 minutes duration.
- The limits of rainfall ARI were between 2 years and 100 years.
- The curves were not in a convenient form for use in modern computer models.
- There was no guidance given for urban areas outside the 42 centres listed.

It is recommended that the curves should be updated by DID to incorporate additional data and extend the coverage as outlined above.

0.0.1 IDF Curves for Other Urban Areas

IDF curves are calculated from local pluviometer data. Recognising that the precipitation data used to derive the above were subject to some interpolation and smoothing, it is desirable to develop IDF curves directly from local rain-gauge records if these records are sufficiently long and reliable. The analyses involve the following steps:

The required analyses are highly specialised and would be outside the scope of interest of most users of this Manual.

Local authorities are advised to find out from the DID to the availability of IDF curves or coefficients for their respective areas, or to obtain local pluviometer data for those wishing to conduct their own analysis.

0.0.2 Polynomial Approximation of IDF Curves

Polynomial expressions in the form of Equation 0.1 have been fitted to the published IDF curves for the 35 main cities/towns in Malaysia.

$$\ln(R_t) = a + b \ln(t) + c(\ln(t))^2 + d(\ln(t))^3 \quad (0.1)$$

where,

R_t = the average rainfall intensity (mm/hr) for ARI and duration t

R = average return interval (years)

t = duration (minutes)

a to d are fitting constants dependent on ARI.

Four coefficients are considered in Equation 0.1 to keep the calculation simple for a reasonable degree of accuracy. Higher degree of polynomial can be used to get more accurate values of rainfall intensity. The Equation can be used for deriving rainfall intensity values for a given duration and ARI, once the values of coefficients a to d are known. The equation is in a more suitable form for most spreadsheet of computer calculation procedures.

The curves in "Hydrological Data" (1991) are valid for durations between 15 minutes and 72 hours. Extrapolation of the curve beyond these limits introduces possible errors, and is not recommended. Also, Equation 0.1 should not be used outside these limits. Alternative procedures for deriving IDF values for short durations are given in Section 0.0.3.

The possible uncertainty range of the IDF figures derived in accordance with this Manual is likely to be up to $\pm 20\%$. Among the sources of error noted are: problems of extrapolation to long ARIs, use of local rather than generalised analysis, and problems with the accuracy of short-duration intensity records. The error is likely to be highest for the durations shorter than 30 minutes and longer than 15 hours, and for ARI longer than 50 years. For particularly critical applications it may be appropriate to conduct sensitivity tests for the effects of design rainfall errors.

Table 0.2 gives values of the fitted coefficients in Equation 0.1 for Kuala Lumpur, for rainfall ARIs between 2 years and 100 years and durations within 30 to 1000 minutes (see Figure 0.1 for the graphs). Appendix 0.A gives derived values of the coefficients in Equation 0.1 for the 26 and 10 urban centres in Peninsular and East Malaysia, respectively. Due to irregular shape of the curves, coefficients for 6 other urban centres in East Malaysia are not suitable to be used in Equation 0.1. IDF values for these 6 stations should be taken from their respective curves available in HP-26 (1983).

Table 0.2 Coefficients of the Fitted IDF Equation for Kuala Lumpur

| ARI (years) | a | b | c | d |
|-------------|--------|--------|---------|--------|
| 2 | 5.3255 | 0.1806 | -0.1322 | 0.0047 |

Figure 0.1 IDF Curves for Kuala Lumpur

0.0.3 IDF Values for Short Duration Storms

It is recommended that Equation 0.1 be used to derive design rainfall intensities for durations down to a lower limit of 30 minutes. This value corresponds to the original range of durations used in deriving the curves.

Estimation of rainfall intensities for durations between 5 and 30 minutes involves extrapolation beyond the range of the data used in deriving the curve fitting coefficients. The recommended method of extending the data is based on HP No.1-1982, which gives a rainfall depth-duration plotting graph for durations between 15 minutes and 3 hours. This graphical procedure was converted into an equation and extended as described below. An additional adjustment for storm intensity was included based on the method used in "PNG Flood Estimation Manual" (SMEC, 1990), for tropical climates similar to Malaysia. This adjustment uses the 2 year, 24-hour rainfall depth ${}^2P_{24h}$ as a parameter.

The design rainfall depth P_d for a short duration d (minutes) is given by,

$$P_d = P_{30} - F_D(P_{60} - P_{30}) \quad (0.2)$$

where P_{30} , P_{60} are the 30-minute and 60-minute duration rainfall depths respectively, obtained from the published design curves. F_D is the adjustment factor for storm duration

Equation 0.2 should be used for durations less than 30 minutes. For durations between 15 and 30 minutes, the results should be checked against the published IDF curves. The relationship is valid for any ARI within the range of 2 to 100 years.

The value of F_D is obtained from Table 0.3 as a function of ${}^2P_{24h}$, the 2-year ARI 24-hour rainfall depth. Values of ${}^2P_{24h}$ for Peninsular Malaysia are given in Figure 0. Error! Bookmark not defined.. Intermediate values should be interpolated.

Note that Equation 0.2 is in terms of rainfall depth, not intensity. If intensity is required, such as for roof drainage, the depth P_d (mm) is converted to an intensity I (mm/hr) by dividing by the duration d in hours:

$$I = \frac{P_d}{d} \quad (0.3)$$

Table 0.3 Values of F_D for Equation 0.2

| Duration (minutes) | ${}^2P_{24h}$ (mm) | | | | |
|-----------------------|--------------------|------|------|------------|------------|
| | West Coast | | | | East Coast |
| | ≤ 100 | 120 | 150 | ≥ 180 | All |
| 5 | 2.08 | 1.85 | 1.62 | 1.40 | 1.39 |
| 10 | 1.28 | 1.13 | 0.99 | 0.86 | 1.03 |
| 15 | 0.80 | 0.72 | 0.62 | 0.54 | 0.74 |
| 20 | 0.47 | 0.42 | 0.36 | 0.32 | 0.48 |

| | | | | | |
|----|------|------|------|------|------|
| 30 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 |
|----|------|------|------|------|------|

Some computer models such as XP-RatHGL (see Chapter 17), require a continuous set of rainfall intensity data for a range of durations. If it is necessary to prepare data for such models, the recommended method is to use Equation 0.2 to derive intensities for short durations and use the resulting values in an IDF table or fitted polynomial curve.

0.0.4 IDF Values for Frequent Storms

Water quality studies, in particular, require data on IDF values for relatively small, frequent storms. These storms are of interest because on an annual basis, up to 90% of the total pollutant load is carried in storms of up to 3 month ARI. Chapter 4 recommends that the *water quality design storm* be that with a 3 month ARI. The typical IDF curves given in Appendix 0.A have a lower limit of 2 years ARI and therefore cannot be used directly.

The following preliminary equations are recommended for calculating the 1, 3, 6-month and 1 year ARI rainfall intensities in the design storm, for all durations:

$${}^{0.083}I_D = 0.4 \times {}^2I_D \quad (0.4a)$$

$${}^{0.25}I_D = 0.5 \times {}^2I_D \quad (0.4b)$$

$${}^{0.5}I_D = 0.6 \times {}^2I_D \quad (0.4c)$$

$${}^1I_D = 0.8 \times {}^2I_D \quad (0.4d)$$

where, ${}^{0.083}I_D$, ${}^{0.25}I_D$, ${}^{0.5}I_D$ and 1I_D are the required 1, 3, 6-month and 1-year ARI rainfall intensities for any duration D , and 2I_D is the 2-year ARI rainfall intensity for the same duration D , obtained from IDF curves.

Users should be aware of the limitations of these Equations 0.4a to 0.4d. They were derived by fitting a distribution to the 1-hour duration rainfalls, and extrapolating the distribution to frequent ARIs. This method is subject to considerable uncertainty. These preliminary equations were derived using Ipoh rainfall data. Further research is required to confirm the relationships, particularly in other parts of Malaysia where different climatic influences apply.

0.0.5 IDF Values for Rare Storms

Further research is required in order to allow design rainfall information to be given for storms with ARI greater than 100 years.

This Manual does not cover the design of major structures such as dams or bridges, for which a special hydrologic analysis is required.

0.1 DESIGN RAINFALL TEMPORAL PATTERNS

0.1.1 Purpose

The temporal distribution of rainfall within the design storm is an important factor that affects the runoff volume, and the magnitude and timing of the peak discharge. Design rainfall temporal patterns are used to represent the typical variation of rainfall intensities during a typical storm burst. Standardisation of temporal patterns allows standard design procedures to be adopted in flow calculation.

It is important to emphasise that these temporal patterns are intended for use in *design* storms. They should not be confused with the real rainfall variability in historical storms.

Realistic estimates of temporal distributions are best obtained by analysis of local rainfall data from recording gauge networks. Such an analysis may have to be done for several widely varying storm durations to cover various types of storms and to produce distributions for various design problems. Different distributions may apply to different climatic regions of the country.

Temporal patterns should be chosen so that the resulting runoff hydrographs are consistent with observed hydrographs. Therefore the form of the temporal pattern and the method of runoff computation are closely inter-linked. The statistical basis of this approach is discussed in "Australian Rainfall and Runoff" (AR&R, 1987).

A range of methods to distribute rainfall have been suggested in the literature:

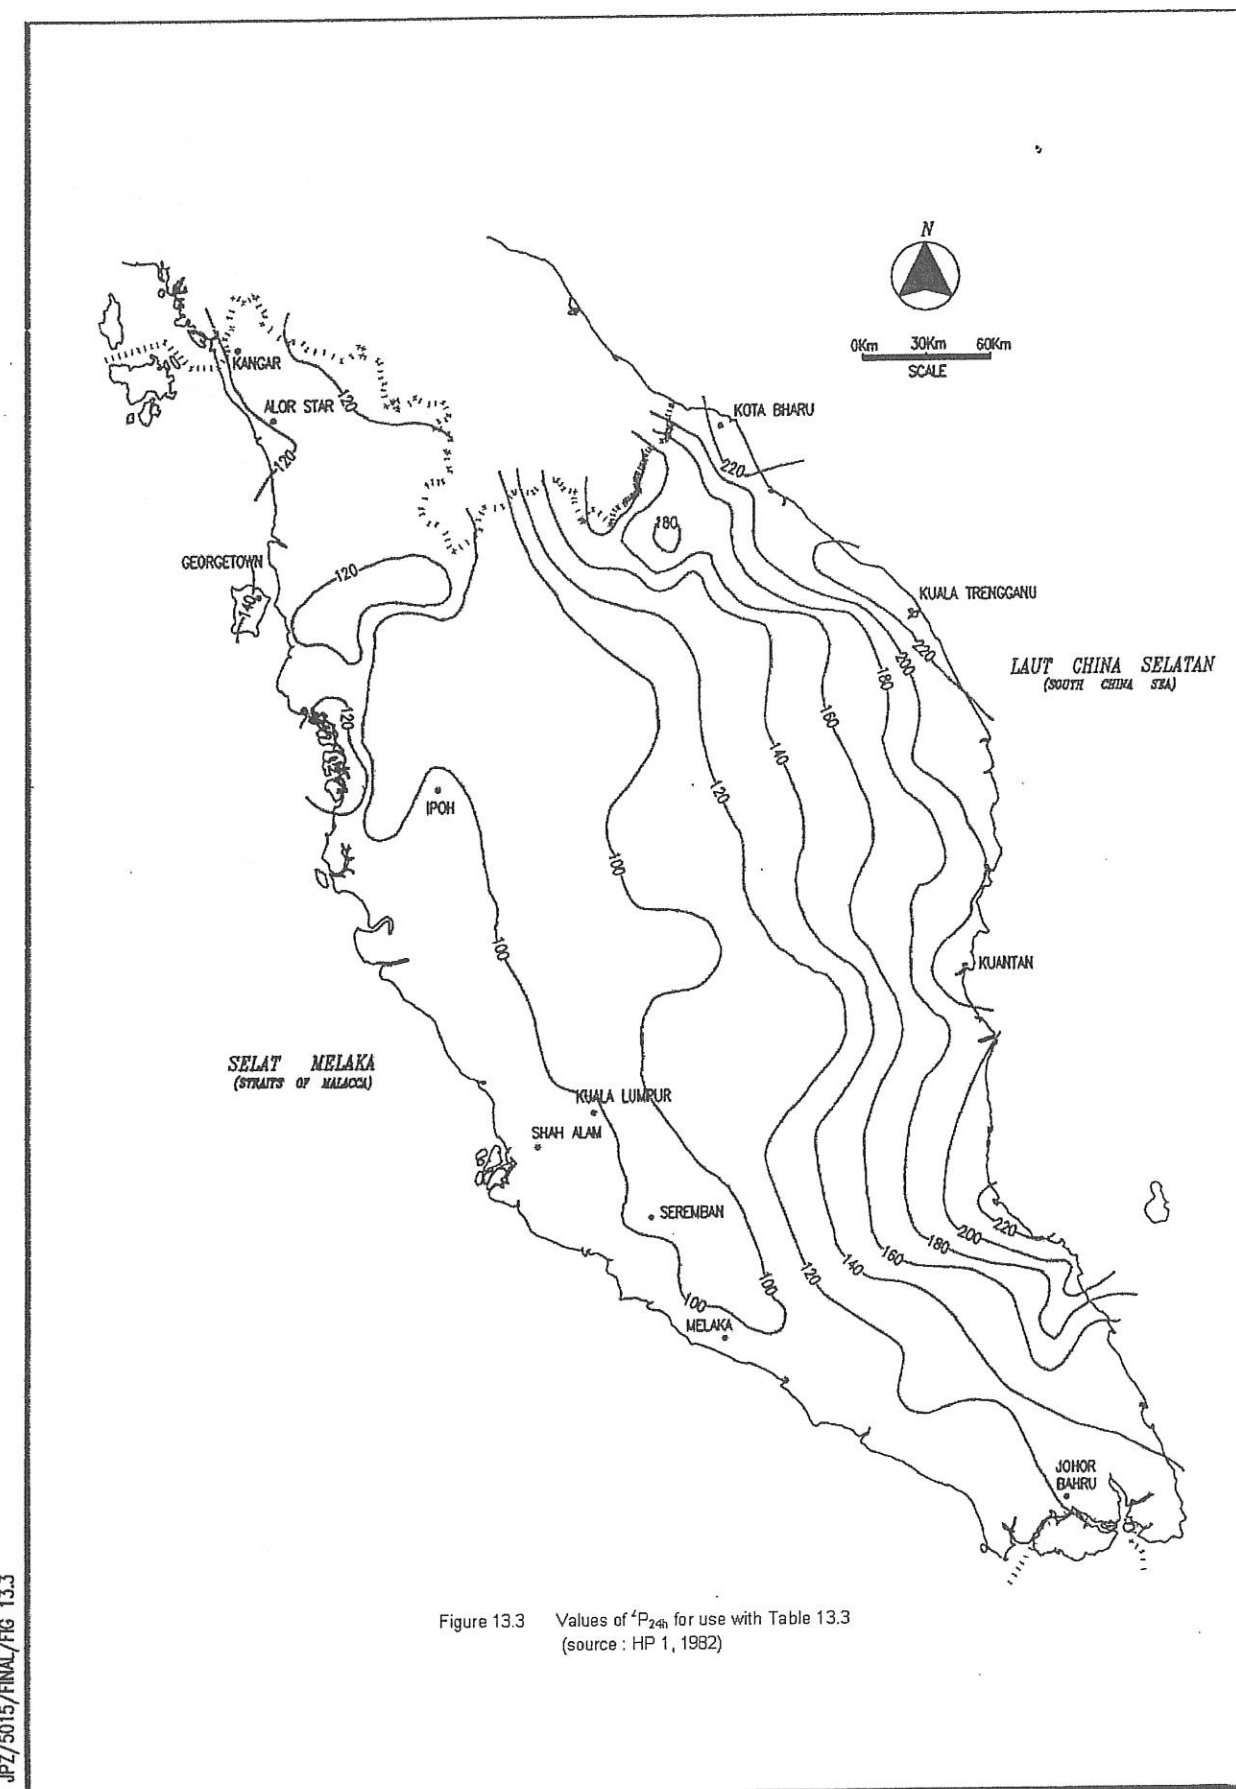

1. Average temporal patterns developed from local point-rainfall data measured in short time intervals (15 minutes or less).
2. Simple idealised rainfall distribution fitted to local storm data by the method of moments.
3. Temporal patterns from local IDF relationships.

The second method is not recommended, as the idealised patterns are not representative of real storm patterns. Triangular patterns, for example, give unrealistically high peak intensities.

The third approach for distributing rainfall within a design storm makes use of the local IDF relationship for the design ARI. This approach is based on the assumption that the maximum rainfall for any duration less than or equal to the total storm duration should have the same ARI. For example, a 10 year ARI three-hour design storm of this type would contain the 10 year ARI rainfall depths for all durations from the shortest time interval considered

(perhaps 5 minutes) up to three hours. These rainfalls are generally skewed.
